molecular mechanisms of tumor pdf

The mechanism of metastasis is a complex set of events that build upon each other to achieve successful growth in organ sites beyond the primary tumor. The cumulative events for metastasis of different cancers have both common and specific cancer specific events.

Given the general mechanisms in cancer metastasis Å-discussed above, we will focus in the following sections upon colorectal and pancreatic carcinomas, two specific cancers of digestive organs regarding their mechanisms, detection, models, and therapeutic targeting of invasion and metastasis.

Metastasis formation is an essential aspect of cancer, for which the molecular underpinning has long been subject to debate. Although the organ preference for dissemination is governed by tumorâ€™host interactions on the epigenetic level there is a genetic basis to the ability of cancer cells to disseminate.
