Operation. Open Shortest Path First (OSPF) was designed as an interior gateway protocol, for use in an autonomous system such as a local area network (LAN). It implements Dijkstra's algorithm, also known as the shortest path first (SPF) algorithm. As a link-state routing protocol it was based on the link-state algorithm developed for the ARPANET in 1980 and the IS-IS routing protocol.

This case study addresses the issue of integrating Routing Information Protocol (RIP) networks with Open Shortest Path First (OSPF) networks. Most OSPF networks also use RIP to communicate with hosts or to communicate with portions of the internetwork that do not use OSPF.

A routing protocol specifies how routers communicate with each other, distributing information that enables them to select routes between any two nodes on a computer network. Routing algorithms determine the specific choice of route. Each router has a prior knowledge only of networks attached to it directly. A routing protocol shares this information first among immediate neighbors, and then ...

What Is Routing? Routing is the act of moving information across an internetwork from a source to a destination. Along the way, at least one intermediate node typically is encountered.

OSPF is a routing protocol defined by RFC 2328. It is designed to manage IP routing inside an AS. OSPF packets use IP protocol number 89. Affected network devices running the OSPF protocol may be impacted by this vulnerability if they receive a crafted LSA type 1 packet.
