The Kirchhoff's Love theory is an extension of Euler-Bernoulli beam theory to thin plates. The theory was developed in 1888 by Love using assumptions proposed by Kirchhoff. It is assumed that a mid-surface plane can be used to represent the three-dimensional plate in two-dimensional form.

Plate tectonics (from the Late Latin tectonicus, from the Greek: *τέκτονικός*, *téktonikós*, "pertaining to building") is a scientific theory describing the large-scale motion of seven large plates and the movements of a larger number of smaller plates of the Earth's lithosphere, since tectonic processes began on Earth between 3 and 3.5 billion years ago. The model builds on the concept of continental ...

Plate tectonics is the theory that explains the global distribution of geological phenomena. Principally it refers to the movement and interaction of the earth's lithosphere.

Plate tectonics is a theory of geology. It explains movement of the Earth's lithosphere which is the earth's crust and the upper part of mantle. The lithosphere is divided into several plate, some of which are very big and can be entire continents. Dissipation of heat from the mantle is the original source of energy driving plate tectonics. Exactly how this works is still a matter of debate.
